

Exercise 1

Find an application of propositional logic in computer science or artificial intelligence and describe it in 150 to 300 words. Share your answer with your peers on the Moodle discussion forum.

Answer

I think that propositional logic is the base of Logical Programming, useful for languages like Prolog and so on, providing a traceable way of modeling.

Besides, if we look at the area of Computer Architecture, logic gates for example, is nearly identical to propositional logic. A deep understanding is essential for building complex computer systems.

In conclusion, we can say that propositional logic is the computational foundation of Computer Science.
